

The extreme male brain theory of autism

Simon Baron-Cohen

The key mental domains in which sex differences have traditionally been studied are verbal and spatial abilities. In this article I suggest that two 'neglectful' systems, 'empathising' and 'systemising'. The male brain is defined psychometrically as those individuals in whom systemising is significantly better than empathising, and the female brain is defined as the opposite cognitive profile. Using these definitions, autism can be considered as an extreme of the normal

The main brain types

A key symptom explained
